(+44) 7840 327112 • akshatsrivastav7@gmail.com • [LinkedIn](#) • [Portfolio](#)

Mobile engineer with strong native iOS experience (UIKit, custom SwiftUI modules, native accessibility work), plus Android (Kotlin) and React Native across production apps. Also works across the stack in Java Spring and MySQL. Currently shipping the order placement journey for the #1 sportsbook in the US, as well as its prediction markets experience; previously led mobile development on a share-plan platform serving 9M+ annual logins.

TECHNICAL SKILLS

- **Languages:** TypeScript, JavaScript, Java, Kotlin, Swift
- **Mobile:** React Native (Paper & Fabric), Expo, native iOS & Android modules, Capacitor, Ionic, Xcode, Android Studio
- **Frameworks & State:** React, Redux, RxJS, Angular, Spring Boot, GraphQL, REST
- **Tools & Infra:** NX, Git, GitHub Actions, Jenkins, Maven, JIRA, Confluence, Datadog, Amplitude, Firebase, Redis, SonarQube, Claude Code, Cursor

EXPERIENCE

FanDuel

Software Engineer

Edinburgh, UK

March 2026 – Present

- Ship React Native features across iOS and Android in a large-scale NX monorepo for the #1 sportsbook in the US, working from native modules through to TypeScript/React components.
- Engineered critical betting flows (fast bets and multi-event parlays) and shipped eligibility and suitability gating for a new embedded product under the One App initiative, coordinating parallel GraphQL queries with per-query loading and error boundaries, colocated fragments, and eligibility-driven conditional routing.
- Improved runtime performance across native and web surfaces by enforcing Redux best practices, memoization, and selector caching to cut unnecessary re-render cycles on high-traffic betting screens.
- Ported monolithic UI components into a shared primitives library, reducing bundle size and build times while enabling reuse across multiple teams and products.
- Maintain and improve CI/CD pipelines on GitHub Actions, actively adding Cypress integration tests to cover legacy code, and managing build agents on Buildkite with techniques such as Jest sharding to optimize pipeline throughput, cutting CI/CD time from 47 minutes to 30.
- On-call engineer for P1–P3 production incidents: identify root causes with Datadog dashboards, RUM, and session replays, and remotely disable features without a deployment using Amplitude and Sanity kill switches.
- Built custom Claude Code skills, MCP integrations, and hooks tailored to the monorepo, automating repetitive workflows such as codebase analysis, test generation, and PR preparation.
- Patched VoiceOver accessibility behaviour by extending React Native's RCTView with Objective-C categories and method swizzling, covering both Paper and Fabric rendering architectures; wrote native Kotlin to intercept Android accessibility events, managing delegate chaining with API-level fallbacks.
- Built as part of an AI-native pod, a one-shot background agent triggerable from Slack, and improved its verification loop with a "verify app" skill that drives simulator automation end-to-end, making manual verification far easier.

Computershare

Full Stack Developer

Edinburgh, UK

Sept 2022 – Mar 2026

- Led mobile development for one of the world's largest Employee Share Plan platforms (9M+ annual logins), building responsive Angular/Ionic UI with NGXS state management and MVVM principles.
- Developed and maintained custom native Capacitor plugins in Swift and Java, and fixed native iOS/Android defects by building JavaScript bridges between native code and TypeScript.
- Built a custom Angular virtual-scroll plugin with a dynamic height strategy, reducing DOM nodes by 70% and improving scroll performance on large, variable-height lists.
- Achieved WCAG 2.1 compliance in collaboration with accessibility experts, refactoring 50+ UI components for ARIA labels, keyboard navigation, and screen-reader support across platforms.
- Designed and built RESTful APIs in Java Spring, alongside database schema design, SQL development, and downstream impact analysis to minimise production risk.
- Automated build creation and Firebase deployment with shell scripts, cutting deployment time from 45 minutes to 10.
- Maintained 85%+ test coverage on critical modules (Jest/Karma frontend, JUnit 5 + Mockito backend) and resolved 100+ SonarQube technical-debt issues, lifting the maintainability score from B to A.

- Mentored three junior developers, ran bi-monthly engineering code camps, and drove code-review standards that reduced integration issues across the team.
- Managed regular Angular/Ionic framework upgrades with thorough post-migration testing and onboarding documentation to support future development.

Travel Together

Founder & Developer

Personal Project

2026 – Present

- Developed a location-based social platform facilitating real-time event discovery and peer-to-peer travel coordination for local communities.
- Migrated the codebase from a legacy Vue.js app to React Native to improve performance and maintainability.
- Implemented real-time messaging over WebSockets, using React Query and QueryClient to manage the connection lifecycle and mutate state as messages arrive.
- Built a native navigation bar and gesture handling in Swift and SwiftUI, implementing Apple's iOS 26 Liquid Glass design through a custom native module.
- Integrated Stripe's native SDK for in-app payments with no external checkout redirect, modeling the full payment lifecycle (loading, processing, success/error, with safe manual retry) as React Query mutation state. Used idempotency keys to protect against duplicate charges on retry, and confirmed order state via Stripe webhooks.
- Built a native photo card component with async image loading and placeholder states to avoid abrupt pop-in, plus a swipeable multi-photo carousel with careful handling of swipe-vs-scroll gesture conflicts.
- Integrated the Google Maps API for geolocation features and real-time event discovery based on user location.
- Built a Redis-backed session system: login issues an opaque token mapped to the user object with a sliding 3-day TTL, a second key enforces single-session-per-user by invalidating old tokens on new login, and logout deletes the token for immediate revocation.

EDUCATION

Swansea University

BSc (Hons) Computer Science, Upper Second Class (2:1)

Swansea, UK

Sept 2019 – July 2022

- Relevant modules: Software Engineering, Algorithms, Artificial Intelligence, Cryptography & IT Security, Big Data & Machine Learning.
